

Quick Release Mounts

4 Sim Rigs

Change your rig in seconds, spend more time in the game!

The QRPro System is designed for rapid mount and dismount of controllers to and from your rig

Note: you will need 2x QRPro Base Mounts to use with this kit.

Before fitting the QRProLogiX55 QR Plate Kit to your Logitech Rhino HOTAS

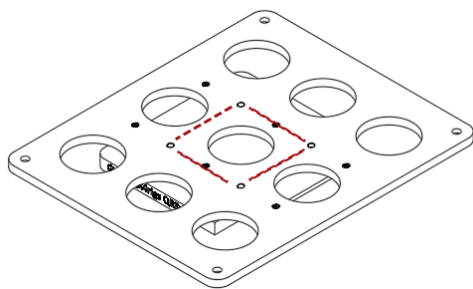

- You may have a single controller and therefore a single QR plate and base mount.
- The following procedure is the same for the Joystick and the Throttle and for both X55 and X56.
- The kit comprises of two identical assembled QR Plates with Adapters fixed on top in the “central position”.

Fitting the QRProLogiX55 QR Plate Kit to your Logitech Rhino HOTAS

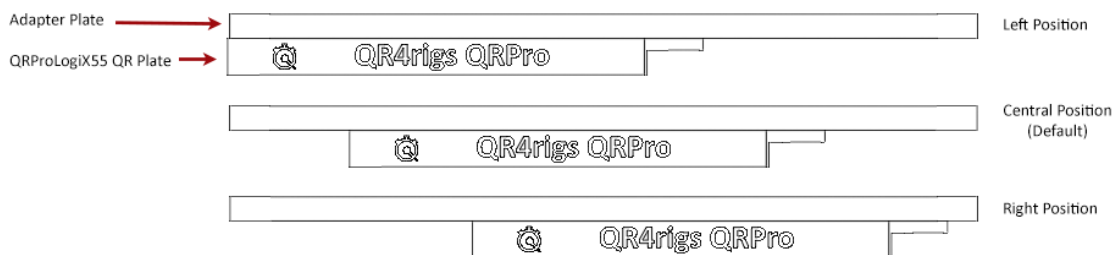

- The joystick is shown in this example, but the same procedure is used for the throttle.
- Using the M5x60mm screws provided, loosely fit the controller to the Adapter plate as shown left.
- Tighten all screws to the pinch. DO NOT overtighten or you may strip the thread inside the plastic adapter plate.
- Repeat the procedure with the other controller.

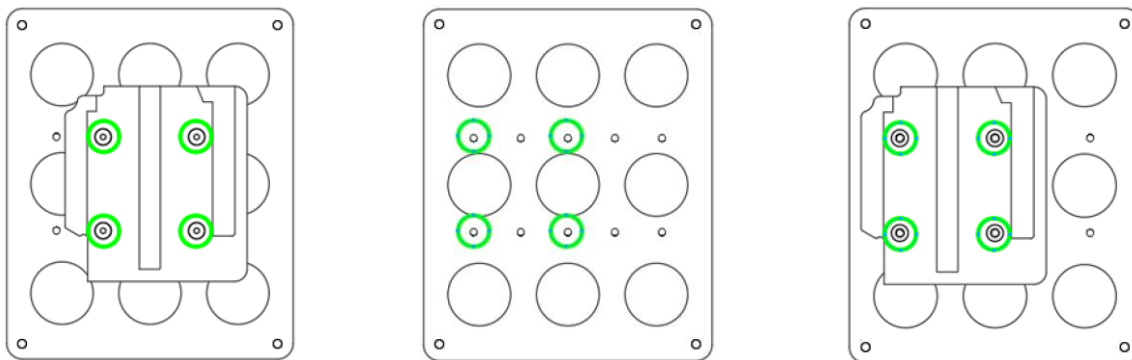

- The adapter plate can easily be moved to the left or the right position to place your controller either closer to or further away from your chair to suit your needs.

- It is possible to change the position after mounting to the joystick or throttle, so no need to make the choice before fitting.

- See below for the 3 positions possible, looking from the rear.

- Remove the 4 screws fixing the QR Plate to the Adapter Plate and relocate the QR Plate to either side (left shown here) and replace the screws in the new position.

DO NOT overtighten any of the screws or you will risk stripping the threads!
